Handheld meter
pH 3150i

pH measuring instrument
Accuracy when going to press
The use of advanced technology and the high quality standard of our instruments are the result of continuous development. This may result in differences between this operating manual and your instrument. Also, we cannot guarantee that there are absolutely no errors in this manual. Therefore, we are sure you will understand that we cannot accept any legal claims resulting from the data, figures or descriptions.

Warranty
We guarantee the instrument described for 3 years from the date of purchase.
The instrument warranty covers manufacturing faults that are discovered within the warranty period. The warranty does not cover components that are replaced during maintenance work, e.g. batteries.

The warranty claim extends to restoring the instrument to readiness for use but not, however, to any further claim for damages. Improper handling or unauthorized opening of the instrument invalidates any warranty claim.

To ascertain the warranty liability, return the instrument and proof of purchase together with the date of purchase freight paid or prepaid.

1 Overview

The compact precision pH 3150i handheld meter enables you to carry out pH measurements rapidly and reliably. The pH 3150i handheld meter provides the maximum degree of operating comfort, reliability and measuring certainty for all applications.

The proven MultiCal® calibration procedure and the special AutoRead function support you in your work with the pH handheld meter.

Note
If you need further information or application notes, you can obtain the following material from WTW:

- Application reports
- Primers
- Safety datasheets.

You will find information on available literature in the WTW catalog or via the Internet.
1.1 SETs of equipment

The measuring instrument is also available as part of individual SETs of equipment. You will find additional information on this and other accessories in the WTW catalog or via the Internet.

Meas. value display
Function and temperature display

1.4 Jack field

1. pH electrode
2. Reference electrode
3. Temperature probe

Warning
Only connect electrodes to the measuring instrument that do not return any unallowed voltages or currents (> SELV and > current circuit with current limiting).
Almost all electrodes - in particular WTW electrodes - fulfill these conditions.
2 Safety

This operating manual contains basic instructions that you must follow during the commissioning, operation and maintenance of the measuring instrument. Consequently, all responsible personnel must read this operating manual carefully before working with the measuring system. The operating manual must always be available within the vicinity of the measuring system.

Target group

The measuring instrument was developed for work in the field and in the laboratory.

We assume that, as a result of their professional training and experience, the operators will know the necessary safety precautions to take when handling chemicals.

Symbols used

Warning

indicates instructions that must be followed to prevent damage to your instrument.

Note

indicates notes that draw your attention to special features.

Note

indicates cross-references to other documents, e.g. application reports, operating manuals of probes, etc.

2.1 Authorized use

The authorized use of the measuring instrument consists exclusively of the pH and ORP measurement in the field and laboratory.

The technical specifications as given in chapter 7 TECHNICAL DATA must be observed. Only the operation and running of the measuring instrument according to the instructions given in this operating manual is authorized.

Any other use is considered to be unauthorized.
2.2 General safety instructions

This instrument is built and inspected according to the relevant guidelines and norms for electronic measuring instruments (see chapter 7 TECHNICAL DATA). It left the factory in a safe and secure technical condition.

Function and operating safety

The smooth functioning and operational safety of the measuring instrument can only be guaranteed if the generally applicable safety measures and the specific safety instructions in this operating manual are followed during operation.

The smooth functioning and operational safety of the measuring instrument can only be guaranteed under the environmental conditions that are specified in chapter 7 TECHNICAL DATA.

If the instrument was transported from a cold environment to a warm environment, the formation of condensate can lead to the faulty functioning of the instrument. In this event, wait until the temperature of the instrument reaches room temperature before putting the instrument back into operation.

Safe operation

If safe operation is no longer possible, the instrument must be taken out of service and secured against inadvertent operation!

Safe operation is no longer possible if the measuring instrument:

- has been damaged in transport
- has been stored under adverse conditions for a lengthy period of time
- is visibly damaged
- no longer operates as described in this manual.

If you are in any doubt, please contact the supplier of the instrument.

Obligations of the purchaser

The purchaser of the measuring instrument must ensure that the following laws and guidelines are observed when using dangerous substances:

- EEC directives for protective labor legislation
- National protective labor legislation
- Safety regulations
- Safety datasheets of the chemical manufacturers.
3 Commissioning

Scope of delivery

- Handheld meter, pH 3150i
- Operating manual and short operating manual
- 4 batteries, 1.5 V Mignon type AA (in the instrument)

For details of scope of delivery of SETs, see chapter 1.1 SETs OF EQUIPMENT and WTW catalog.
4 Operation

4.1 Switching on the measuring instrument

1. Press the <ON/OFF> key. The display test appears briefly on the display. Subsequently, the slope and asymmetry that are used appear for approx. one second one after the other. In addition, the calibration procedure of the last calibration is shown (AutoCal TEC or AutoCal DIN, or no display in the delivery state or after a reset). The measuring instrument then switches to the measuring mode that was last selected.

2. Connect the pH electrode to the measuring instrument. The instrument is ready for operation.
4.2 Measuring
Perform the following preparatory activities when you want to measure:

1. Connect the electrode to the measuring instrument.
2. Calibrate or check the measuring instrument with the electrode.
3. Select the measuring mode with <M>.

Note
Incorrect calibration of pH electrodes leads to incorrect measured values. Calibrate regularly before measuring.

Temperature sensor
Basically, pH measurements should only be performed using a temperature probe. The temperature probe is shown on the display by TP.

If you nevertheless use an electrode without a temperature probe, the instrument operates with a reference temperature of 25 °C. Thus, the sample and calibration solution must have their temperatures adjusted to 25 °C in order to avoid larger measurement errors.

Note
The pH meter automatically recognizes the type of temperature probe used. This enables electrodes to be connected with the NTC30 or Pt1000.
4.2.1 Measuring the pH value

1. Perform the preparatory activities according to section 4.2.
2. Immerse the pH electrode into the test sample.
3. Press the <M> key until pH appears on the status display. The pH value appears on the display.

Changing the pH resolution

The measuring instrument shows the pH measured value with a resolution of 0.01 or 0.001 (default setting is 0.01). To change over the resolution, press the <M> key while pressing the <RUN/ENTER> key.

AutoRead AR (drift control)

The AutoRead function (drift control) checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of the measured values.

For identical measurement conditions, the following criteria apply:

<table>
<thead>
<tr>
<th>Reproducibility</th>
<th>Response time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Better than 0.02</td>
<td>&gt; 30 seconds</td>
</tr>
</tbody>
</table>

1. Call up the pH measuring mode with <M>.
2. Activate the AutoRead function with <AR>. The current measured value is frozen (hold function).
3. Start AutoRead with <RUN/ENTER>. The AR display indicator flashes until a stable signal is reached.
4. If necessary, start the next AutoRead measurement with <RUN/ENTER>.
5. To terminate AutoRead: Press the <AR> key.

Note

The current AutoRead measurement can be terminated at any time (accepting the current value) by pressing <RUN/ENTER>.
4.2.2 Measuring the ORP voltage

In conjunction with an ORP electrode, e.g. SenTix ORP, the measuring instrument can measure the ORP voltage (U) of a solution.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Perform the preparatory activities according to section 4.2.</td>
</tr>
<tr>
<td>2</td>
<td>Immerse the ORP electrode in the test sample.</td>
</tr>
<tr>
<td>3</td>
<td>Press the &lt;M&gt; key until U appears on the status display. The ORP voltage (mV) of the sample appears on the display.</td>
</tr>
<tr>
<td>4</td>
<td>Wait for a stable measured value.</td>
</tr>
</tbody>
</table>

![Display showing ORP voltage](image)

**Note**

ORP electrodes are not calibrated. However, you can check ORP electrodes using a test solution.
4.3 Calibrating

**Why calibrate?**

pH electrodes age. This changes the asymmetry (zero point) and slope of the pH electrode. As a result, an inexact measured value is displayed. Calibration determines the current values of the asymmetry and slope of the electrode and stores them in the measuring instrument.

Thus, you should calibrate at regular intervals.

**Note**

Always calibrate after replacing the pH electrode.

You can select between two calibration procedures:

**AutoCal TEC**

is specially adapted to the WTW technical buffer solutions as a fully automatic **two-point** or **three-point calibration**. The buffer solutions are automatically recognized by the measuring instrument. Depending on the instrument setting (see section 4.4 CONFIGURATION), the instrument displays the relevant buffer nominal value or the current electrode voltage in mV. The calibration can be terminated after the first buffer solution. This corresponds to a **single-point calibration**. To do this, the instrument uses the standard slope (-59.2 mV/pH at 25 °C) and determines the asymmetry of the electrode.

**AutoCal DIN**

is specially adapted to the permanently programmed buffer solutions in accordance with DIN 19266 as a fully automatic **two-point** or **three-point calibration**. The operating sequence of the AutoCal DIN calibration corresponds to that of the AutoCal TEC calibration. The calibration can only be terminated after the first buffer solution (**single point calibration**).

**AutoRead**

When calibrating with AutoCal TEC and AutoCal DIN, the AutoRead function is automatically activated. The current AutoRead measurement can be terminated at any time (accepting the current value) by pressing **<RUN/ENTER>**.

**Displaying calibration data**

Each time the instrument is switched on, the calibration data are shown on the display for a short time (see section 4.1 SWITCHING ON THE MEASURING INSTRUMENT). In order to view the calibration data, switch the measuring instrument off and switch it on again.
Calibration evaluation

After the calibration, the measuring instrument automatically evaluates the current status of the electrode. The asymmetry and slope are evaluated separately. The worst evaluation appears on the display.

<table>
<thead>
<tr>
<th>Display</th>
<th>Asymmetry [mV]</th>
<th>Slope [mV/pH]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-15 ... +15</td>
<td>-60.5 ... -58</td>
</tr>
<tr>
<td></td>
<td>-20 ... +20</td>
<td>-58 ... -57</td>
</tr>
<tr>
<td></td>
<td>-25 ... +25</td>
<td>-61 ... -60.5 or -57 ... -56</td>
</tr>
<tr>
<td></td>
<td>-30 ... +30</td>
<td>-62 ... -61 or -56 ... -50</td>
</tr>
</tbody>
</table>

Clean the electrode according to the electrode operating manual

Eliminate the error according to chapter 6 WHAT TO DO IF...

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>-30 or &gt; 30</td>
<td>&lt; -30 or &gt; 30</td>
</tr>
</tbody>
</table>

1. Connect the pH electrode to the measuring instrument.
2. Keep the buffer solutions ready.
3. Adjust the temperature of the solution and measure the current temperature if the measurement is made without the use of a temperature sensor (the TP display indicator is missing from the display).
4.3.1 AutoCal TEC

For this procedure, use any two or three WTW technical buffer solutions in ascending or descending order (pH values at 25 °C: 2.00 / 4.01 / 7.00 / 10.01).

**Note**
The calibration for pH 10.01 is optimized for the WTW technical buffer solution TEP 10 Trace or TPL 10 Trace. Other buffer solutions can lead to an erroneous calibration. The correct buffer solutions are given in the WTW catalog or in the Internet.

**Note**
The buffer solutions are automatically recognized by the measuring instrument. Depending on the instrument setting (see section 4.4 CONFIGURATION), the instrument displays the relevant buffer nominal value or the current electrode voltage in mV.

1. Press the `<CAL>` key repeatedly until the Ct1 display indicator and the function display AutoCal TEC appears. The sensor symbol displays the evaluation of the last calibration (or no sensor symbol in the delivery state or after the measurement parameter has been reset).

2. Immerse the pH electrode in the first buffer solution.

3. Press the `<RUN/ENTER>` key. The AR display indicator flashes. The electrode voltage (mV) or the buffer nominal value appears on the display. Example:
Note
At this point, the AutoCal TEC calibration can be terminated with <M>. This corresponds to a single-point calibration. To do this, the instrument uses the standard slope (-59.2 mV/pH at 25 °C) and determines the asymmetry of the electrode.

4 When the measured value is stable, Ct2 appears.

5 Thoroughly rinse the electrode with deionized water.

6 Immerse the pH electrode in the second buffer solution.

7 Press the <RUN/ENTER> key. The AR display indicator flashes. The electrode voltage (mV) or the buffer nominal value appears on the display. Example:
When the measured value is stable, \( AR \) disappears. The value of the slope (mV/pH) appears on the display. The probe symbol shows the evaluation of the current calibration (two-point calibration).

Press the <RUN/ENTER> key. The value of the asymmetry (mV) appears on the display.

Change to the measuring mode with <M>, or proceed to the three-point calibration with <RUN/ENTER>.
Three-point calibration

11 Press the <RUN/ENTER> key. Ct3 appears on the display.

12 Thoroughly rinse the electrode with distilled water.

13 Immerse the pH electrode in the third buffer solution.

14 Press the <RUN/ENTER> key. The AR display indicator flashes. The electrode voltage (mV) or the buffer nominal value appears on the display. Example:

15 When the measured value is stable, AR disappears. The value of the slope (mV/pH) appears on the display. The probe symbol shows the evaluation of the current calibration (three-point calibration).
16 Press the <RUN/ENTER> key. The value of the asymmetry (mV) appears on the display.

17 Switch to the measuring mode with <M>. The three-point calibration is complete.
4.3.2 AutoCal DIN

For this procedure, use two or three different standard buffer solutions according to DIN 19266 in ascending or descending order (type A, C, D or F with pH values at 25 °C of: 1.679 / 4.006 / 6.865 / 9.180).

**Note**
The buffer solutions are automatically recognized by the measuring instrument. Depending on the instrument setting (see section 4.4 CONFIGURATION), the instrument displays the relevant buffer nominal value or the current electrode voltage in mV.

1. Press the <CAL> key repeatedly until the display Cd1 and the function display AutoCal DIN appear. The sensor symbol displays the evaluation of the last calibration (or no sensor symbol in the delivery state or after the measurement parameter has been reset).

2. Immerse the pH electrode in the first buffer solution.

3. Press the <RUN/ENTER> key. The AR display indicator flashes. The electrode voltage (mV) or the buffer nominal value appears on the display. Example:

4. When the measured value is stable, C12 appears.
Note
At this point, the AutoCal TEC calibration can be terminated with <M>. This corresponds to a **single-point calibration**. To do this, the instrument uses the standard slope (-59.2 mV/pH at 25 °C) and determines the asymmetry of the electrode.

5 Thoroughly rinse the electrode with deionized water.

6 Immerse the pH electrode in the second buffer solution.

7 Press the <RUN/ENTER> key. The AR display indicator flashes. The electrode voltage (mV) or the buffer nominal value appears on the display. Example:

8 When the measured value is stable, AR disappears. The value of the slope (mV/pH) appears on the display. The probe symbol shows the evaluation of the current calibration (two-point calibration).
Press the <RUN/ENTER> key. The value of the asymmetry (mV) appears on the display.

Change to the measuring mode with <M>, or proceed to the three-point calibration with <RUN/ENTER>.
Three-point calibration

11 Press the <RUN/ENTER> key. Ct3 appears on the display.

12 Thoroughly rinse the electrode with distilled water.

13 Immerse the pH electrode in the third buffer solution.

14 Press the <RUN/ENTER> key. The AR display indicator flashes. The electrode voltage (mV) or the buffer nominal value appears on the display. Example:

15 When the measured value is stable, AR disappears. The value of the slope (mV/pH) appears on the display. The probe symbol shows the evaluation of the current calibration (three-point calibration).
16 Press the <RUN/ENTER> key. The value of the asymmetry (mV) appears on the display.

17 Switch to the measuring mode with <M>. The three-point calibration is complete.
4.4 Configuration

You can adapt the following setting to your individual requirements (the default setting is marked in bold):

| Display during the pH calibration | Buffer nominal value, current electrode voltage |

1. Switch off the measuring instrument.
2. Press the <M> key and hold it down.
3. Press the <ON/OFF> key.
   Display test appears briefly on the display. Afterwards, the measuring instrument switches automatically to the setting of the display during the pH calibration.
4. Select the required display during the pH calibration with <CAL>.
   - mV: Display of the current electrode voltage
   - /pH: Display of the buffer nominal value.
5. Confirm with <RUN/ENTER>.
   The measuring instrument automatically switches to the measuring mode.
4.5 Reset

The following settings are reset to the default values when a reset is performed (initialized):

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measuring mode</td>
<td>pH</td>
</tr>
<tr>
<td>Asymmetry</td>
<td>0 mV</td>
</tr>
<tr>
<td>Slope</td>
<td>-59.16 mV/pH</td>
</tr>
<tr>
<td>Calibration procedure</td>
<td>AutoCal TEC</td>
</tr>
<tr>
<td>Resolution of pH display</td>
<td>0.01 (low resolution)</td>
</tr>
</tbody>
</table>

Proceed as follows:

1. Press the <RUN/ENTER> key and hold it down.
2. Press the <CAL> key.
3. Confirm with <RUN/ENTER>. The settings are reset. The pH meter switches to the pH measuring mode.

Retaining settings:
Use <M> to change to the pH measuring mode without a reset.
5 Maintenance, cleaning, disposal

5.1 Maintenance
The measuring instrument is almost maintenance-free. The only maintenance task is replacing the batteries. *LoBat* indicates that the batteries should be changed. The batteries are then largely depleted.

Replacing the batteries

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| 1 | Open the housing after the instrument has been switched off:  
   – Undo the four screws on the underside of the instrument  
   – Pull down the lower cover (1). |
| 2 | If necessary, take the four depleted batteries (2) out of the battery compartment. |
| 3 | Place four new batteries (type Mignon AA) in the battery compartment. |
| 4 | Close the lower cover (1). |

**Warning**
Make sure that the poles of the batteries are the right way round. The ± signs on the batteries must correspond to the ± signs in the battery compartment. Only use leakproof alkaline manganese batteries.
Note
For the maintenance of the electrodes, follow the corresponding operating manual.

5.2 Cleaning
Occasionally wipe the outside of the measuring instrument with a damp, lint-free cloth. Disinfect the housing with isopropanol as required.

Warning
The housing is made of a synthetic material (ABS). Thus, avoid contact with acetone and similar detergents that contain solvents. Remove any splashes immediately.

5.3 Disposal

Packing
This measuring instrument is sent out in a protective transport packing. We recommend: Keep the packing material. The original packing protects the instrument against damage during transport.

Batteries
This note refers to the battery regulation that applies in the Federal Republic of Germany. We would ask end-consumers in other countries to follow their local statutory provisions.

Note
This instrument contains batteries. Batteries that have been removed must only be disposed of at the recycling facility set up for this purpose or via the retail outlet. It is illegal to dispose of them in household refuse.

Measuring instrument
Dispose of the measuring instrument as electronic waste at an appropriate collection point. It is illegal to dispose of the instrument in household refuse.

**FCC Class A Equipment Statement**

*Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.*

8 Lists

This chapter provides additional information and orientation aids.

**Abbreviations**

The list of abbreviations explains the indicators and the abbreviations that appear on the display and in the manual.

**Specialist terms**

The glossary briefly explains the meaning of the specialist terms. However, terms that should already be familiar to the target group are not described here.

**Index**

The index will help you to find the topics that you are looking for.

</table>
| ARng         | Automatic range switching  
|              | Measuring instrument measures with highest resolution |
| ASY          | Asymmetry |
| AutoCal DIN  | Automatic pH calibration with buffer solutions prepared according to DIN 19266 |
| AutoCal TEC  | Automatic pH calibration with WTW technical buffer solutions according to DIN 19267 |
| °C           | Temperature unit, degrees Celsius |
| Cal          | Calibration |
| Cd...        | Display indicator during calibration for pH measurements. Indicates the selection of the buffer data record for buffer solutions prepared according to DIN 19266 |
| Ct...        | Display indicator during calibration for pH measurements. Indicates the selection of the buffer data records for WTW technical buffer solutions |
| E3           | Error message  
|              | see chapter 6 WHAT TO DO IF... |
| LoBat        | Batteries almost empty  
|              | (Low Battery) |
| mV           | Voltage unit |
| mV/pH        | Unit of the electrode slope (internat. mV) |
| OFL          | Display range exceeded (Overflow) |
| pH           | pH value |
| SELV         | Safety Extra Low Voltage |
| TP           | Temperature measurement active (Temperature Probe) |
| UASY         | Asymmetry |
## Glossary

### Adjusting
To manipulate a measuring system so that the relevant value (e.g., the displayed value) differs as little as possible from the correct value or a value that is regarded as correct, or that the difference remains within the tolerance.

### Asymmetry
Designation for the offset potential of a pH electrode. It is the measurable potential of a symmetrical electrode, the membrane of which is immersed in a solution with the pH of the nominal electrode zero point (WTW electrodes: pH = 7).

### AutoRange
Name of the automatic selection of the measuring range.

### AutoRead
WTW name for a function to check the stability of the measured value.

### Calibration
Comparing the value from a measuring system (e.g., the displayed value) to the correct value or a value that is regarded as correct. Often, this expression is also used when the measuring system is adjusted at the same time (see adjusting).

### Diaphragm
The junction is a porous body in the housing wall of reference electrodes or electrolyte bridges. It forms the electrical contact between two solutions and makes electrolyte exchange more difficult. The expression, junction, is also used for ground or junction-less transitions.

### Electrode voltage
The electromotive force \( U \) of the electrode is the measurable electromotive force of an electrode in a solution. It equals the sum of all the galvanic voltages of the electrode. Its dependency on the pH results in the electrode function which is characterized by the parameters, slope and zero point.

### Electrode zero point
The zero point of a pH electrode is the pH value at which the electromotive force of the pH electrode at a specified temperature is zero. Normally, this is at 25 °C.

### Measured parameter
The measured parameter is the physical dimension determined by measuring, e.g., pH, conductivity or D.O. concentration.

### Measured value
The measured value is the special value of a measured parameter to be determined. It is given as a combination of the numerical value and unit (e.g., 3 m; 0.5 s; 5.2 A; 373.15 K).

### Measuring system
The measuring system comprises all the devices used for measuring, e.g., measuring instrument and probe. In addition, there is the cable and possibly an amplifier, terminal strip and armature.

### Molality
Molality is the quantity (in Mol) of a dissolved substance in 1000 g solvent.

### MultiCal®
WTW name stating that a measuring instrument provides several calibration procedures.
| **Offset potential** | The measurable potential of a symmetrical electrode, the membrane of which is immersed in a solution with the pH of the nominal electrode zero point. The asymmetry is part of the offset potential. |
| **ORP voltage** | The ORP is caused by oxidizing or reducing substances dissolved in water if these substances become effective on an electrode surface (e.g. a gold or platinum surface). |
| **pH value** | The pH is a measure of the acidic or basic effect of an aqueous solution. It corresponds to the negative decadic logarithm of the molal hydrogen ions activity divided by the unit of the molality. The practical pH value is the value of a pH measurement. |
| **Reference temperature** | Fixed temperature value to compare temperature-dependent measured values. For conductivity measurements, the measured value is converted to a conductivity value at a reference temperature of 20 °C or 25 °C. |
| **Reset** | Restoring the original condition of all settings of a measuring system. |
| **Resolution** | Smallest difference between two measured values that can be displayed by a measuring instrument. |
| **Sample** | Designation of the sample ready to be measured. Normally, a test sample is made by processing the original sample. The test sample and original sample are identical if the test sample was not processed. |
| **Slope** | The slope of a linear calibration function. |
