Multi 3410

Digital pH / D.O. / conductivity meter for a digital IDS sensor
Accuracy when going to press

The use of advanced technology and the high quality standard of our instruments are the result of a continuous development. This may result in differences between this operating manual and your meter. Also, we cannot guarantee that there are absolutely no errors in this manual. Therefore, we are sure you will understand that we cannot accept any legal claims resulting from the data, figures or descriptions.

1 Overview

The compact, digital precision meter Multi 3410 enables you to carry out pH measurements, ORP measurements, conductivity measurements and dissolved oxygen (D.O.) measurements quickly and reliably.

The Multi 3410 provides the maximum degree of operating comfort, reliability and measuring certainty for all applications.

The Multi 3410 supports you in your work with the following functions:

- proven calibration procedures
- automatic stability control (AR),
- automatic sensor recognition,
- CMC (continuous measurement control)
- QSC (sensor quality control).

1 Keypad
2 Display
3 Socket field
The two USB interfaces (USB-A and USB-B) enable you to:

- Transmit data to
  - a USB memory device
  - a PC
- Update the meter firmware.

1.1 Keypad

In this operating manual, keys are indicated by brackets <..>.

The key symbol (e.g. <MENU/ENTER>) generally indicates a short keystroke (under 2 sec) in this operating manual. A long keystroke (approx. 2 sec) is indicated by the underscore behind the key symbol (e.g. <MENU/ENTER_>).

**CAUTION**

Only connect sensors to the meter that cannot return any voltages or currents that are not allowed (> SELV and > current circuit with current limiting).

WTW IDS sensors and IDS adapters meet these requirements.
1.4 Automatic sensor recognition

The automatic sensor recognition for IDS sensors allows

- to operate an IDS sensor at different meters without recalibration
- to operate different IDS sensors at one meter without recalibration
- to assign measurement data to an IDS sensor
  - Measurement datasets are always stored and output with the sensor name and sensor series number.
- to assign calibration data to an IDS sensor
  - Calibration data and calibration history are always stored and output with the sensor name and sensor series number.
- to activate the correct cell constant for conductivity sensors automatically
- to hide menus automatically that do not concern this sensor

To be able to use the automatic sensor recognition, a meter that supports the automatic sensor recognition (e.g. Multi 3410) and a digital IDS sensor are required.

In digital IDS sensors, sensor data are stored that clearly identify the sensor.
The sensor data are automatically taken over by the meter.

1.5 IDS sensors

IDS sensors

- support the automatic sensor recognition
- show only the settings relevant to the specific sensor in the setting menu
- process signals in the sensor digitally so that precise and interference-free measurements are enabled even with long cables
- facilitate to assign a sensor to a measured parameter with differently colored couplings
- have quick-lock couplings with which to fix the sensors to the meter.

Note

Information on available IDS sensors is given on the Internet and in the WTW catalog, "Laboratory and field instrumentation".
Sensor data from IDS sensors

IDS sensors transmit the following sensor data to the meter:

- **SENSOR ID**
  - Sensor name
  - Sensor series number
- **Calibration data**
  - Calibration date
  - Calibration characteristics
  - Calibration interval
  - Selected buffer set (IDS pH sensors only)
  - Cell constant (IDS conductivity sensors only)
  - Calibration history of the last 10 calibrations
- **Measurement settings (IDS conductivity sensors only)**
  - The set measured parameter
  - The set reference temperature
  - The set temperature coefficient
  - The set TDS factor

The calibration data are updated in the IDS sensor after each calibration procedure. A message is displayed while the data are being updated in the sensor.

**Note**
In the measured value display, you can display the sensor name and series number of the selected sensor with the [Info] softkey. You can then display all further sensor data stored in the sensor with the [More] softkey.

### 1.6 IDS adapter for analog sensors

With the aid of an IDS adapter, you can also operate analog sensors on the Multi 3410. An IDS adapter and analog sensor together behave like an IDS sensor.
The measuring electronics with the stored adapter data are in the adapter head. The adapter data correspond to the sensor data.

**Note**
Information on available IDS adapters is given on the Internet and in the WTW catalog, "Laboratory and field instrumentation". Detailed information on the IDS adapter is given in the operating manual of the adapter.
2 Safety

This operating manual contains basic instructions that you must follow during the commissioning, operation and maintenance of the meter. Consequently, all responsible personnel must read this operating manual before working with the meter. The operating manual must always be available within the vicinity of the meter.

Target group
The meter was developed for work in the field and in the laboratory. Thus, we assume that, as a result of their professional training and experience, the operators will know the necessary safety precautions to take when handling chemicals.

Safety instructions
Safety instructions in this operating manual are indicated by the warning symbol (triangle) in the left column. The signal word (e.g. "Caution") indicates the level of danger:

**WARNING**
indicates instructions that must be followed precisely in order to avoid possibly great dangers to personnel.

**CAUTION**
indicates instructions that must be followed precisely in order to avoid the possibility of slight injuries or damage to the meter or the environment.

Further notes
**Note** indicates notes that draw your attention to special features.

**Note** indicates cross-references to other documents, e.g. operating manuals.
2.1 Authorized use

The authorized use of the meter consists exclusively of the measurement of the pH, ORP, conductivity and dissolved oxygen in a field and laboratory environment.

The technical specifications as given in chapter 7 TECHNICAL DATA must be observed. Only the operation and running of the meter according to the instructions given in this operating manual is authorized. Any other use is considered unauthorized.

2.2 General safety instructions

This meter is constructed and tested in compliance with the IEC 1010 safety regulations for electronic measuring instruments. It left the factory in a safe and secure technical condition.

Function and operational safety

The smooth functioning and operational safety of the meter can only be guaranteed if the generally applicable safety measures and the specific safety instructions in this operating manual are followed during operation.

The smooth functioning and operational safety of the meter can only be guaranteed under the environmental conditions that are specified in chapter 7 TECHNICAL DATA.

If the meter was transported from a cold environment to a warm environment, the formation of condensate can lead to the faulty functioning of the meter. In this event, wait until the temperature of the meter reaches room temperature before putting the meter back into operation.

**CAUTION**
The meter is only allowed to be opened by authorized personnel.
Safe operation
If safe operation is no longer possible, the meter must be taken out of service and secured against inadvertent operation!
Safe operation is no longer possible if the meter:
- has been damaged in transport
- has been stored under adverse conditions for a lengthy period of time
- is visibly damaged
- no longer operates as described in this manual.

If you are in any doubt, please contact the supplier of the meter.

Obligations of the purchaser
The purchaser of this meter must ensure that the following laws and guidelines are observed when using dangerous substances:
- EEC directives for protective labor legislation
- National protective labor legislation
- Safety regulations
- Safety datasheets of the chemical manufacturers.

CAUTION
In addition to the safety instructions mentioned here, also follow the safety instructions of the sensors used.
The operating manuals of the sensors are available on the supplied CD and on the Internet under www.WTW.com.
3 Commissioning

3.1 Scope of delivery

- Meter Multi 3410
- 4 NiMH rechargeable batteries 1.2 V Mignon type AA
- USB cable (A plug on mini B plug)
- Power pack
- Short instructions
- Detailed operating manual (4 languages)
- CD-ROM

3.2 Power supply

The Multi 3410 is supplied with power in the following ways:

- Battery operation with NiMh rechargeable batteries
- Mains operation with the supplied power pack.
  The NiMh rechargeable batteries are automatically charged while the power pack is connected.
- USB operation via a connected USB-B cable.
  The inserted NiMh rechargeable batteries are not charged

3.3 Initial commissioning

Perform the following activities:

- Insert the rechargeable batteries and charge them
- Connect the power pack (mains operation / battery charging)
- Switch on the meter
- Set the date and time

3.3.1 Inserting the rechargeable batteries

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Unscrew the two screws (1) on the underside of the meter.</td>
</tr>
<tr>
<td>2</td>
<td>Open the battery compartment (2) on the underside of the meter.</td>
</tr>
</tbody>
</table>
3 Place four rechargeable batteries (type Mignon AA) in the battery compartment.

**CAUTION**
Make sure that the poles of the rechargeable batteries are positioned correctly.
The ± signs on the batteries must correspond to the ± signs in the battery compartment.

4 Close the battery compartment (2) and tighten the screws (1).

### 3.3.2 Connecting the power pack / charging the batteries

**CAUTION**
The line voltage at the operating site must lie within the input voltage range of the original power pack (see section 7.1).

**CAUTION**
Use original power packs only (see section 7.1).

**CAUTION**
The batteries in the battery compartment are automatically charged when the power pack is connected.
Make sure that only NiMH rechargeable batteries are in the battery compartment. The charging process is optimized for NiMH rechargeable batteries. Other battery types can cause damage during the charging process.
During mains operation, one of the following symbols is displayed:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
</table>
| 🌩️ | Mains operation with charge function  
Batteries are automatically charged in the background. |
| 🌩️ | Mains operation |

**Note**
Charge the batteries completely prior to putting the meter into operation for the first time. The charging process takes approx. 10 hours. The symbol is displayed if the batteries are nearly discharged.

### 3.3.3 Switching on the meter

1. Press the <On/Off> key.
   - The meter performs a self-test.
   - The display shows the manufacturer's logo while the self-test is being performed.

2. Connect the sensor.
   - The meter switches to the measuring mode (measured value display).

**Note**
The meter has an energy saving feature to avoid unnecessary power consumption during battery operation.
The energy saving feature switches off the meter during battery operation if no key is pressed during the adjusted interval. (How to set the switch-off interval, see section 4.4).
The switch-off interval of the energy saving feature is not active when the meter is supplied with power via the power pack or the USB-B cable.
3.3.4 Setting the date and time

3  See section 4.3.4
4 Operation

4.1 Switching on the meter

Switching on Press the <On/Off> key.
The meter performs a self-test.
The display shows the manufacturer's logo while the self-test is being performed.
If a sensor is connected, the measured value display appears.

Switching off Press the <On/Off> key.

4.2 Login with a user name

After activation of the user administration by the administrator, measurements are only possible after login with a user name. The user name is documented with the measured values and in records.

All user names entered by the administrator are listed in the User name menu. The administrator determines for each user whether or not a password is required for login to the meter.

If the Password menu item is grayed out, no password is required for login.

1 Switch on the meter with <On/Off>. The Login dialog box appears.
Note
The login is done immediately if no password is required.
If a sensor is connected the measured value display appears.

4 If a password is required:
Using , enter the Password menu item and confirm with <MENU/ENTER>.

Note
The user specifies the password when he or she first logs in with a user name.
A valid password consists of 4 digits.
The user can change the password with the next login.

5  the password was completely entered, confirm with <MENU/ENTER>.
The login takes place. If a sensor is connected the measured value display appears.
Changing the password

If the administrator has set up the access with password protection:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch on the meter with <code>&lt;On/Off&gt;</code>. The <em>Login</em> dialog box appears.</td>
</tr>
<tr>
<td>2</td>
<td>Enter the <em>Benutzername</em> menu item and confirm with <code>&lt;MENU/ENTER&gt;</code>. The user name is highlighted.</td>
</tr>
<tr>
<td>3</td>
<td><code>&lt;MENU/ENTER&gt;</code></td>
</tr>
<tr>
<td>4</td>
<td>Enter the <em>Change password</em> <code>&lt;MENU/ENTER&gt;</code></td>
</tr>
<tr>
<td>5</td>
<td>Enter the old password in the <em>Password</em> and confirm with <code>&lt;MENU/ENTER&gt;</code></td>
</tr>
<tr>
<td>6</td>
<td>Enter the new password in the <em>New password</em> and confirm with <code>&lt;MENU/ENTER&gt;</code>. The password is changed. The login takes place. If a sensor is connected the measured value display appears.</td>
</tr>
</tbody>
</table>

Forgotten the password?

Contact the administrator.
4.3 General operating principles

This section contains basic information on the operation of the Multi 3410.

Operating elements, display
An overview of the operating elements and the display is given in section 1.1 and section 1.2.

Operating modes, navigation
An overview of the operating modes and navigation of the Multi 3410 is given in section 4.3.1 and section 4.3.2.

4.3.1 Operating modes

The meter has the following operating modes:

- **Measuring**
  The measurement data of the connected sensor is shown in the measured value display

- **Calibration**
  The course of a calibration with calibration information, functions and settings is displayed

- **Storage in memory**
  The meter stores measuring data automatically or manually

- **Data transmission**
  The meter transmits measuring data and calibration records to a USB-B interface automatically or manually.

- **Setting**
  The system menu or a sensor menu with submenus, settings and functions is displayed
4.3.2 Navigation

**Measured value display**

In the measured value display, you can

- open the menu for calibration and measurement settings with `<MENU/ENTER>` (short keystroke)
- open the system menu with the sensor-independent settings by pressing `<MENU/ENTER>` Storage & config for a `<MENU/ENTER>` long keystroke, approx. 2 s).
- change the display in the selected measuring window (e.g. pH > mV) by pressing `<M>`.

**Menus and dialogs**

The menus for settings and dialogs in procedures contain further submenus. The selection is made with the `<▲>` `<▼>` keys. The current selection is displayed with a frame.

- **Submenus**
  The name of the submenu is displayed at the upper edge of the frame. Submenus are opened by confirming with `<MENU/ENTER>`. Example:

  ![Submenu Example](image)

- **Settings**
  Settings are indicated by a colon. The current setting is displayed on the right-hand side. The setting mode is opened with `<MENU/ENTER>` . Subsequently, the setting can be changed with `<▲>` `<▼>` and `<MENU/ENTER>`. Example:

  ![Setting Example](image)
• **Functions**

Functions are designated by the name of the function. They are immediately carried out by confirming with <MENU/ENTER>. Example: Display the *Calibration record* function.

![Calibration record](image)

**Messages**

Information is marked by the [i] symbol. They cannot be selected. Example:

![Calibration record](image)

**Note**

The principles of navigation are explained in the two following sections by reference of examples:

- Setting the language (section 4.3.3)
- Setting the date and time (see section 4.3.4).
### 4.3.3 Example 1 on navigation: Setting the language

1. Press the `<On/Off>` key.  
The measured value display appears.  
The instrument is in the measuring mode.

2. Open the `Storage & config` menu with `<MENU/ENTER>`.  
The instrument is in the setting mode.

3. Select the `System` submenu with `<▲><▼>`.  
The current selection is displayed with a frame.

4. Open the `System` submenu with `<MENU/ENTER>`.
5 Select the General submenu with \(<\uparrow><\downarrow>\). The current selection is displayed with a frame.

6 Open the General submenu with \(<\text{MENU/ENTER}>\).

7 Open the setting mode for the Language with \(<\text{MENU/ENTER}>\).
4.3.4 Example 2 on navigation: Setting the date and time

The measuring instrument has a clock with a date function. The date and time are indicated in the status line of the measured value display. When storing measured values and calibrating, the current date and time are automatically stored as well.

The correct setting of the date and time and date format is important for the following functions and displays:

- Current date and time
- Calibration date
- Identification of stored measured values.

Therefore, check the time at regular intervals.

**Note**

After a fall of the supply voltage (empty batteries), the date and time are reset to 01.08.2009 00:00 hours.

**Setting the date, time and date format**

The date format can be switched from the display of day, month, year (dd.mm.yy) to the display of month, day, year (mm/dd/yy or mm.dd.yy).

1. In the measured value display:
   Open the Storage & config menu with <MENU/ENTER>. The instrument is in the setting mode.

2. Select and confirm the System / Clock function menu with <▲><▼> and <MENU/ENTER>. The setting menu for the date and time opens up.

8. Select the required language with <▲><▼>.

9. Confirm the setting with <MENU/ENTER>. The meter switches to the measuring mode. The selected language is active.
3 Select and confirm the Time menu with <▲><▼> and <MENU/ENTER>. The hours are highlighted.

4 Change and confirm the setting with <▲><▼> and <MENU/ENTER>. The minutes are highlighted.

5 Change and confirm the setting with <▲><▼> and <MENU/ENTER>. The seconds are highlighted.

6 Change and confirm the setting with <▲><▼> and <MENU/ENTER>. The time is set.

7 If necessary, set the Date and Date format. The setting is made similarly to that of the time.

8 If necessary, select and set the Date with <▲><▼> and <MENU/ENTER>.

9 To make further settings, switch to the next higher menu level with <ESC>.
   or
   Switch to the measured value display with <M>. The instrument is in the measuring mode.
4.4 Sensor-independent settings

The Storage & config menu includes the following settings:

- **System** (see section 4.4.1).
- **Data storage** (see section 4.4.2)

### 4.4.1 System

**Overview**

The following sensor-independent meter characteristics can be adjusted in the Storage & config/System menu:

- Menu language
- Beep on keystroke
- Loudness of the beep
- Illumination
- Brightness
- Interval of the automatic switchoff
- Data interface
- Clock and date function
- Reset of all sensor-independent system settings to the default condition

**Settings**

To open the Storage & config menu, press the <MENU/ENTER> key in the measured value display. After completing the settings, switch to the measured value display with <M>. Default settings are printed in **bold**.

4.4.2 Data storage

This menu contains all functions to display, edit and erase stored measured values.

Note
Detailed information on the storage functions of the Multi 3410 is given in section 4.10.

4.4.3 Automatic Stability control

The automatic Stability control (AutoRead) function continuously checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values.

You can activate or switch off the automatic Stability control function (see section 4.4).

The measured parameter flashes on the display
- as soon as the measured value is outside the stability range
- when you switch over between the measured parameters with <M>.
- when the automatic Stability control is switched off.

4.4.4 Automatic switch-off

The instrument has an automatic switch-off function in order to save the batteries (see section 4.4.1). The automatic switch-off switches off the measuring instrument if no key is pressed for an adjustable period.

The automatic switch-off is not active
- if the power pack is connected
- if a USB-B cable is connected
- if the Automatic data storage function is active, or with automatic data transmission

4.4.5 Display illumination

The meter automatically switches the display illumination to energy saving mode if no key is pressed for 20 seconds.
After a further 60 seconds, the meter switches off the display illumination completely.
The illumination is switched on with the next keystroke again.

You can also generally switch on the display illumination (see section 4.4.1).
4.5 Sensor info

You can display the current sensor data and sensor settings of a connected sensor at any time. The sensor data are available in the measured value display with the [Info] softkey.

1. In the measured value display:
   Display the sensor data (sensor name, series number) with [Info].

2. Display further sensor data (settings) with [More].

4.6 pH value

4.6.1 General information

You can measure the following parameters:

- pH value [ ]
- Sensor voltage [mV]

Note

The sensor connection and the USB-B (device) interface are galvanically isolated. This enables interference-free measurements in grounded measuring media.

Temperature measurement

For reproducible pH measurements, it is essential to measure the temperature of the test sample. IDS sensors measure the temperature with a temperature sensor integrated in the IDS sensor.

When operating a sensor without integrated temperature sensor, e.g. via an IDS pH adapter, you have to determine and input the temperature of the measuring medium first.

Preparatory activities

Perform the following preparatory activities when you want to measure:

<table>
<thead>
<tr>
<th></th>
<th>Connect the IDS pH sensor to the meter. The pH measuring window is displayed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>If necessary, select the measured parameter with &lt;M&gt;.</td>
</tr>
<tr>
<td>3</td>
<td>If necessary, calibrate or check the IDS pH sensor.</td>
</tr>
</tbody>
</table>
### 4.6.2 Measuring the pH value

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Perform the preparatory activities according to section 4.6.1.</td>
</tr>
<tr>
<td>2</td>
<td>Immerse the IDS pH sensor in the test sample.</td>
</tr>
</tbody>
</table>

#### Stability control (AutoRead)

The stability control function (AutoRead) continually checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values. The display of the measured parameter flashes until a stable measured value is available.

You can start the Stability control manually at any time, irrespective of the setting for automatic Stability control (see section 4.4.3) in the System menu.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Freeze the measured value with &lt;AR&gt;. The [HOLD] status indicator is displayed.</td>
</tr>
<tr>
<td>2</td>
<td>Using &lt;MENU/ENTER&gt;, activate the Stability control function manually. The [AR] status indicator appears while the measured value is assessed as not stable. A progress bar is displayed and the display of the measured parameter flashes. The [HOLD][AR] status indicator appears as soon as a stable measured value is recognized. The progress bar disappears and the display of the measured parameter stops flashing. The current measurement data is output to the interface. Measurement data meeting the stability control criterion is marked by AR.</td>
</tr>
</tbody>
</table>
**Note**
You can prematurely terminate the *Stability control* function manually with `<MENU/ENTER>` at any time. If the *Stability control* function is prematurely terminated, the current measurement data are output to the interface without the AutoRead info.

3 | Release the frozen measured value again with `<AR>` or `<M>`. The [AR] status display disappears. The display switches back to the previous indication.

**Criteria for a stable measured value**

The *Stability control* function checks whether the measured values are stable within the monitored time interval.

<table>
<thead>
<tr>
<th>Measured parameter</th>
<th>Time interval</th>
<th>Stability in the time interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH value</td>
<td>15 seconds</td>
<td>Δ pH: Better than 0.01</td>
</tr>
<tr>
<td>Temperature</td>
<td>15 seconds</td>
<td>Δ T (° C): Better than 0.02</td>
</tr>
</tbody>
</table>

The minimum duration until a measured value is assessed as stable is the monitored time interval. The actual duration is mostly longer.
### 4.6.3 Settings for pH measurements

#### Overview
The following settings are possible for pH measurements:
- *Calibration record* (display)
- *Calibration data storage* (display)
- *Calibration interval*
- Buffers for calibration
- *Single-point calibration*
- *Unit for slope*
- *Resolution*

#### Settings
The settings are made in the menu for calibration and measurement settings of the pH/ORP measurement. To open the settings, display the required parameter in the measured value display and press the `<MENU/ENTER>` key. After completing the settings, switch to the measured value display with `<M>`.

Default settings are printed in **bold**.

### 4.6.4 pH calibration

#### Why calibrate?
During the operation of an IDS pH sensor, the zero point (asymmetry) and slope of the sensor change with time. As a result, an inexact measured value is displayed. Calibration determines the current values of the zero point and slope of the pH sensor and stores them in the measuring instrument. Thus, you should calibrate at regular intervals.

#### When do you have to calibrate?
- When the calibration interval has expired

#### Buffer sets for calibration
You can use the buffer sets quoted in the table for an automatic calibration. The pH values are valid for the specified temperature values. The temperature dependence of the pH values is taken into consideration during the calibration.

<table>

**Note**
The buffers are selected in the menu, pH / <MENU/ENTER> / Calibration / Buffer (see section 4.6.3).
Calibration points

Calibration can be performed using one to five buffer solutions in any order (single-point to five-point calibration). The meter determines the following values and calculates the calibration line as follows:

<table>
<thead>
<tr>
<th>Determined values</th>
<th>Displayed calibration data</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-point Asy</td>
<td>● Zero point = Asy</td>
</tr>
<tr>
<td></td>
<td>● Slope = Nernst slope (-59.2 mV/pH at 25 °C)</td>
</tr>
<tr>
<td>2-point Asy, Slp.</td>
<td>● Zero point = Asy</td>
</tr>
<tr>
<td></td>
<td>● Slope = Slp.</td>
</tr>
<tr>
<td>3-point to 5-point Asy, Slp.</td>
<td>● Zero point = Asy</td>
</tr>
<tr>
<td></td>
<td>● Slope = Slp.</td>
</tr>
<tr>
<td></td>
<td>The calibration line is calculated by linear regression.</td>
</tr>
</tbody>
</table>

Note

You can display the slope in the units, mV/pH or % (see section 4.6.3).

Stability control

The calibration procedure automatically activates the stability control function. The current measurement with stability control can be terminated at any time (accepting the current value).

Calibration record

The new calibration values are displayed when a calibration procedure is completed.

Display calibration data and output to interface

You can have the data of the last calibration displayed (see section 4.6.8). Subsequently, you can transmit the displayed calibration data to the interface, e. g. to a PC, with the <PRT> key.

Note

The calibration record is automatically transmitted to the interface after calibrating.
Sample record

</tr>
</tbody>
</table>

Clean the IDS sensor according to the sensor operating manual

Error Error < -30 or > 30 ... -62 or ... -50

Eliminate the error according to chapter 6 WHAT TO DO IF...

Note

For pH IDS sensors, you can optionally enable a more finely graded calibration evaluation (QSC) (see section 4.6.10).
Preparatory activities

Perform the following preparatory activities when you want to calibrate:

1. Connect the IDS pH sensor to the meter. The pH measuring window is displayed.
2. Keep the buffer solutions ready.

4.6.5 Calibration interval

The calibration evaluation is displayed as a sensor symbol. After the QSC function has been enabled the sensor symbol is replaced by the QSC color scale (see section 4.6.10).

After the specified calibration interval has expired, the sensor symbol or the QSC color scale flashes. It is still possible to measure.

Note
To ensure the high measuring accuracy of the measuring system, calibrate after the calibration interval has expired.

Setting the calibration interval

The calibration interval is set to 7 days (d7) in the factory. You can change the interval (1 ... 999 days):

1. Open the menu for measurement settings with <MENU/ENTER>.
2. In the Calibration / Calibration interval menu, set the calibration interval with <▲><▼>.
3. Confirm the setting with <MENU/ENTER>.
4. Quit the menu with <M>.
### 4.6.6 Carrying out an automatic calibration (AutoCal)

Make sure that in the sensor menu, *Buffer* menu, the buffer set is correctly selected (see section 4.6.3).

Use any one to five buffer solutions of the selected buffer set in ascending or descending order.

Below, calibration with Technical buffers (TEC) is described. When other buffer sets are used, other nominal buffer values are displayed. Apart from that, the procedure is identical.

**Note**

If single-point calibration was set in the menu, the calibration procedure is automatically finished with the measurement of buffer solution 1 and the calibration record is displayed.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>

**AutoCal TEC**

- **AR**
- **22.09.2009 08:00**
Continuing with three- to five-point calibration

15. Thoroughly rinse the IDS pH sensor with deionized water.

16. Immerse the IDS pH sensor in the next buffer solution.

17. When measuring without temperature sensor:
   - Measure the temperature of the buffer manually and enter it with <▲><▼>.

18. Start the measurement with <MENU/ENTER>.
   - The measured value is checked for stability (stability control).
   - The [AR] status indicator is displayed. The measured parameter flashes.

19. Wait for the measurement with stability control to be completed or terminate the stability control and take over the calibration value with <MENU/ENTER>.
   - The calibration display for the next buffer appears (voltage display).

20. If necessary, use <M> to finish the calibration.
    - The calibration record is displayed.
    - or
    - Switch to calibration with the next buffer with <MENU/ENTER>.

**Note**

Calibration is automatically completed after the last buffer of a buffer set has been measured. Then the calibration record is displayed.

The calibration line is determined by linear regression.
4.6.7 Carrying out a manual calibration (ConCal)

Make sure that in the sensor menu, Buffer menu, the ConCal buffer set is correctly selected (see section 4.6.3).

Use any one to five buffer solutions in ascending or descending order.

<td>If necessary, use <code>&lt;M&gt;</code> to finish the calibration. The calibration record is displayed. or Continue calibrating using the next buffer with <code>&lt;MENU/ENTER&gt;</code>.</td>
</tr>
</tbody>
</table>

### Note
After the fifth buffer has been measured the calibration is automatically finished. Then the calibration record is displayed. The calibration line is determined by linear regression.
4.6.8 Displaying calibration records

The calibration data can be displayed and then output to the interface.

The calibration record of the last calibration is to be found under the menu item, Calibration / Calibration record. To open it in the measured value display, press the <CAL> key.

The calibration records of the last 10 calibrations are to be found in the menu, Calibration / Calibration data storage / Display. To open the Calibration menu, press the <MENU/ENTER> key in the measured value display.

<table>

4.6.9 Continuous measurement control (CMC function)

The Continuous Measurement Control (CMC function) facilitates to evaluate the current measured value instantly and definitely.

After each successful calibration the scale of the pH measuring range is displayed in the measured value display. Here you can very clearly see whether or not the current measured value is in the calibrated part of the measuring range.

The following information is displayed:

1. Measuring range for which a valid calibration is available (background color). Measured values in this range are suitable for documentation.

2. Measuring range for which no valid calibration is available (light gray). Measured values in this range are not suitable for documentation. Calibrate the meter with buffers covering this measuring range.
   - If the current measured value is not in the calibrated range, the color of this range changes to dark gray.
   - If a measured value is outside the measuring range pH 0 - 14, overflow arrows are displayed at the left or right edge of the measuring range.

3. Currently measured pH value (needle)

4. Marking lines for all nominal buffer values used with the last valid calibration

The limits of the calibrated range are determined by the buffers used for calibration:

<table>
<thead>
<tr>
<th>Limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lower limit</td>
<td>Buffer with lowest pH value - 2 pH units</td>
</tr>
<tr>
<td>Upper limit</td>
<td>Buffer with highest pH value + 2 pH units</td>
</tr>
</tbody>
</table>
4.6.10 QSC function (sensor quality control)

The QSC function (Quality Sensor Control) is a new sensor evaluation for digital IDS sensors. It evaluates the condition of an IDS pH sensor individually and with a very fine grading.

On the display, the QSC color scale (from green to yellow) indicates the current sensor evaluation by means of a pointer.

In the printout, the sensor evaluation is quoted as a percentage (1-100).

The finely graded sensor evaluation of the QSC function promptly calls your attention to changes of the sensor. Thus you can do what is necessary to restore the optimum measuring quality (e.g. clean, calibrate or replace the sensor).

<table>
<thead>
<tr>
<th>With QSC function</th>
<th>Without QSC function (sensor symbol)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Very fine grading of the sensor evaluation (100 grades)</td>
<td>Rough grading of the sensor evaluation (4 grades)</td>
</tr>
<tr>
<td>The reference value is individually determined for each sensor during the QSC initial calibration.</td>
<td>A theoretical reference value is used for all sensors</td>
</tr>
<tr>
<td>Low tolerances for zero point and slope when using QSC buffer solutions</td>
<td>Greater tolerances for zero point and slope when using commercial buffer sets</td>
</tr>
<tr>
<td>Additional QSC calibration required (with special QSC buffer set)</td>
<td>No additional calibration required</td>
</tr>
</tbody>
</table>
**QSC calibration**

The QSC function is enabled by once carrying out an additional three-point calibration with special QSC buffer solutions. It covers the measuring range of the sensor from pH 2 to pH 11. The QSC initial calibration determines the actual condition of the sensor and stores it as a reference in the sensor.

To meet the high requirements of a QSC initial calibration, the QSC initial calibration should optimally be carried out with the initial commissioning of the sensor.

Carry out the normal calibrations for your special measuring range with your usual standard solutions as previously done.

**Note**

As soon as the QSC function was enabled for an IDS sensor, it is not possible to return to the sensor evaluation with the sensor symbol for this sensor.

**Carrying out a QSC initial calibration**

1. Open the menu for measurement settings with `<MENU/ENTER>`.

2. In the QSC menu, select `First calibration` with `<▲>`.<▼>. The calibration display appears. AutoCal QSC-Kit is displayed as the buffer. Exclusively use the QSC-Kit for the QSC calibration. If you use other buffers, you will have no valid QSC calibration.

3. Calibration with the buffers of the QSC-Kit is done like a normal three-point calibration. Follow the user guide.

**Note**

Carry out the QSC initial calibration very carefully. It determines the reference value for the sensor. This reference value cannot be overwritten or reset.

As soon as the QSC function was enabled, it is not possible to return to the sensor evaluation with the sensor symbol.
As soon as the three-point calibration has been successfully carried out you can decide whether to accept or discard the calibration as the QSC initial calibration.

The QSC initial calibration is completed. The sensor is calibrated. If you want to calibrate with special buffers for your measurements, you can subsequently carry out a normal calibration with your buffers. The reference values determined with the QSC calibration are also used for the evaluation of normal calibrations. In the measured value display, the color scale of the QSC function is always displayed. A double arrow on the color scale indicates the current sensor evaluation.

Carrying out a QSC control calibration

1. Open the menu for measurement settings with <MENU/ENTER>.

2. In the QSC menu, select Control calibration with <▲><▼>. The calibration display appears. AutoCal QSC-Kit is displayed as the buffer. Exclusively use the QSC-Kit for the QSC calibration. If you use other buffers, you will have no valid QSC control calibration.

3. Follow the user guide. The calibration is carried out like a normal three-point calibration. As soon as the three-point calibration has been successfully carried out you can decide whether to accept or discard the calibration as the QSC control calibration.
4.7  ORP voltage

4.7.1  General information

You can measure the following parameters:

- ORP [mV]

**Note**
The sensor connection and the USB-B (device) interface are galvanically isolated. This enables interference-free measurements in grounded measuring media.

**Preparatory activities**
Perform the following preparatory activities when you want to measure:

1. Connect the IDS ORP sensor to the meter. The ORP measuring window is displayed.
2. Check the meter with the IDS ORP sensor.

4.7.2  Measuring the ORP

**Note**
IDS ORP sensors are not calibrated. However, you can check IDS ORP sensors using a test solution.

1. Perform the preparatory activities according to section 4.6.1.
2. Immerse the IDS ORP sensor in the test sample.

3. Select the mV display with <M>.
Stability control (AutoRead)

The stability control function (AutoRead) continually checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values. The display of the measured parameter flashes until a stable measured value is available.

You can start the Stability control manually at any time, irrespective of the setting for automatic Stability control (see section 4.4.3) in the System menu.

1. Freeze the measured value with <AR>. The [HOLD] status indicator is displayed.

2. Using <MENU/ENTER>, activate the Stability control function manually. The [AR] status indicator appears while the measured value is assessed as not stable. A progress bar is displayed and the display of the measured parameter flashes. The [HOLD][AR] status indicator appears as soon as a stable measured value is recognized. The progress bar disappears and the display of the measured parameter stops flashing. The current measurement data is output to the interface. Measurement data meeting the stability control criterion is marked by AR.

Note

You can prematurely terminate the Stability control function manually with <MENU/ENTER> at any time. If the Stability control function is prematurely terminated, the current measurement data are output to the interface without the AutoRead info.

3. Release the frozen measured value again with <AR> or <M>. The [AR] status display disappears. The display switches back to the previous indication.

Criteria for a stable measured value

The Stability control function checks whether the measured values are stable within the monitored time interval.

<table>
<thead>
<tr>
<th>Measured parameter</th>
<th>Time interval</th>
<th>Stability in the time interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORP voltage</td>
<td>15 seconds</td>
<td>Δ mV: Better than 0.3</td>
</tr>
</tbody>
</table>

The minimum duration until a measured value is assessed as stable is the monitored time interval. The actual duration is mostly longer.
4.7.3 Settings for ORP measurements

Overview
The following settings are possible for ORP measurements:
- Resolution
- Automatic stability control

Settings
The settings are made in the menu for measuring settings of the ORP measurement. To open the settings, display the required parameter in the measured value display and press the <MENU/ENTER> key. After completing the settings, switch to the measured value display with <M>. Default settings are printed in **bold**.

<table>

<td>-</td>
<td>Resets all sensor settings to the delivery condition (see section 4.12.1)</td>
</tr>
</tbody>
</table>
4.8 Dissolved oxygen

4.8.1 General information

You can measure the following parameters:
- D.O. concentration
- D.O. saturation index ("D.O. saturation")
- D.O. partial pressure

Note
The sensor connection and the USB-B (device) interface are galvanically isolated. This enables interference-free measurements in grounded measuring media.

Temperature measurement

IDS D.O. sensors measure the temperature with a temperature sensor integrated in the IDS sensor.

Preparatory activities

Perform the following preparatory activities when you want to measure:

1. Connect the D.O. sensor to the meter. The D.O. measuring window is displayed.

2. Check or calibrate the meter with the sensor.

Note
The FDO® 925 needs to be calibrated in special cases only. Regular FDO® Checks are sufficient.
4.8.2 Measuring

1. Perform the preparatory activities according to section 4.9.1.
2. Immerse the D.O. sensor in the test sample.

Selecting the displayed measured parameter

You can switch between the following displays with <M>:
- D.O. concentration [mg/l]
- D.O. saturation [%]
- D.O. partial pressure [mbar].

Salinity correction

When measuring the concentration of solutions with a salt content of more than 1 g/l, a salinity correction is required. For this, you have to measure and input the salinity of the measured medium first.

When the salinity correction is switched on, the [SAL] indicator is displayed in the measuring window.

Note

You can switch the salinity correction on or off and enter the salinity in the menu for calibration and measurement settings (see section 4.9.4).

Freezing the measured value (HOLD function)

With the HOLD function, you can freeze the current measured value. The displayed measured value stops changing until you switch the HOLD function off.

1. Freeze the measured value with <AR>. The [HOLD] status indicator is displayed.

Note

If the HOLD function is active, you can, e.g. start a manual measurement with stability control.
Stability control (AutoRead)

The stability control function (AutoRead) continually checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values. The display of the measured parameter flashes until a stable measured value is available.

You can start a measurement with Stability control manually at any time, irrespective of the setting for automatic Stability control (see section 4.4.3) in the System menu.

<table>
<thead>

</table>
4.8.4 FDO® Check procedure (check of the FDO® 925)

Why should you check the sensor?
With the FDO® Check procedure, you can find out in a simple manner whether the FDO® 925 D.O. sensor should be cleaned or calibrated.

When should you check the sensor?
Checking can be useful in the following cases:
- When the check interval has expired
- If the measured values seem to be implausible
- If you assume that the sensor cap is contaminated or at the end of its lifetime
- After the sensor cap was exchanged
- Routinely within the scope of company quality assurance measures.

FDO® Check procedure
Check in water vapor-saturated air.
Use the check and storage vessel (FDO® Check) to carry out the FDO® Check procedure.

Stability control (AutoRead)
The Stability control function (AutoRead) is automatically activated for the FDO® Check.

Carrying out the FDO® Check procedure
Proceed as follows to carry out the FDO® Check procedure:

1. Connect the D.O. sensor to the meter.
2. Place the D.O. sensor in the check and storage vessel, FDO® Check.

Note
The sponge in the check and storage vessel must be moist (not wet). Leave the sensor in the check and storage vessel long enough so it can adapt to the ambient temperature.

3. In the measuring menu, start the FDO® Check procedure with FDO Check / Start FDO Check. The meter switches to the measured parameter, %.
Evaluation

The evaluation is based on the accuracy required by the user. Together with the nominal value (100 %), this results in a validity scope for the check.

If the measured value is within the validity scope, no cleaning or user calibration is required.

If the measured value is outside the validity scope, the sensor shaft and membrane should be cleaned, and the check should then be repeated (see section 5.4.1).

Example:

- Required accuracy: ± 2 %.
- In water vapor-saturated air or air-saturated water, the nominal value for the relative D.O. saturation (abbreviated: saturation) is 100 %.
- Therefore, the validity scope is 98 ... 102 %
- The check resulted in a measured value of 99,3 %

The measurement error is within the specified validity scope. No cleaning or user calibration is required.
4.8.5 D.O. calibration

Why calibrate? D.O. sensors age. This changes the slope of the D.O. sensor. Calibration determines the current slope of the sensor and stores this value in the instrument.

Note
The FDO® 925 D.O. sensor ages so little it does not have to be regularly calibrated. To detect changes of the sensor as early as possible, the FDO® Check procedure can be useful (see section 4.8.4).

When to calibrate?
- If your evaluation of the FDO® Check procedure suggests a calibration
- When the calibration interval has expired
- If your accuracy requirements are especially high
- Routinely within the scope of company quality assurance measures.

Calibration procedures
Calibration in water vapor-saturated air. To calibrate the FDO® 925 sensor, use the check and storage vessel, FDO® Check.

Stability control (AutoRead)
In calibration, the Stability control function (AutoRead) is automatically activated.

Display calibration data and output to interface
You can have the data of the last calibration displayed (see section 4.9.6). Subsequently, you can transmit the displayed calibration data to the interface, e.g. to a PC, with the <PRT> key.

Note
The calibration record is automatically transmitted to the interface after calibrating.

Calibration evaluation
After the calibration, the meter automatically evaluates the current status of the calibration. The evaluation appears on the display and in the calibration record.
Proceed as follows to calibrate the D.O. sensor:

1. Connect the D.O. sensor to the meter.
2. Place the FDO® 925 D.O. sensor into the check and storage vessel, FDO® Check.

**Note**
The sponge in the check and storage vessel must be moist (not wet). Leave the sensor in the check and storage vessel long enough so it can adapt to the ambient temperature.

3. Start the calibration with <CAL>. The last calibration data (relative slope) is displayed.
4 Start the measurement with <MENU/ENTER>. The measured value is checked for stability (stability control). The [AR] status indicator is displayed. The measured parameter flashes.

5 Wait for the AutoRead measurement to be completed ([HOLD][AR]) display or accept the calibration value with <MENU/ENTER>. The calibration record is displayed and output to the interface.

6 Switch to the measured value display with <MENU/ENTER>.
4.8.6 Displaying calibration records

The calibration data can be displayed and then output to the interface.

The calibration record of the last calibration is available under the menu item, Calibration / Calibration record. To open it in the measured value display, press the <CAL> key.

The calibration records of the last 10 calibrations are available in the menu, Calibration / Calibration data storage / Display. To open the Calibration menu, press the <MENU/ENTER> key in the measured value display.

4.9 Conductivity

4.9.1 General information

You can measure the following parameters:
- Conductivity
- Specific resistance
- Salinity
- Total dissolved solids (TDS)

**Note**
The sensor connection and the USB-B (device) interface are galvani-
cally isolated. This enables interference-free measurements in
grounded measuring media.

**Temperature measurement**
IDS sensors measure the temperature with a temperature sensor inte-
grated in the IDS sensor.

**Preparatory activities**
Perform the following preparatory activities when you want to measure:

1. Connect an IDS conductivity sensor to the meter.
   The conductivity measuring window is displayed.
   The *Measuring cell* and cell constant for the connected IDS
   conductivity sensor are automatically taken over.

4.9.2 Measuring

You can carry out conductivity measurements as follows:

1. Perform the preparatory activities according to section 4.9.1.
2. Immerse the IDS conductivity sensor in the test sample.

- Salinity SaL [ ]
- Total dissolved solids TDS [mg/l] / [g/l]

The factor to calculate the total dissolved solids is set to 1.00 in the factory. You can adjust this factor to meet your requirements in the range of 0.40 to 1.00. The factor is set in the menu for the parameter, TDS.

Freezing the measured value (HOLD function)

With the HOLD function, you can freeze the current measured value. The displayed measured value stops changing until you switch the HOLD function off.

1. Freeze the measured value with <AR>. The [HOLD] status indicator is displayed.

Note

If the HOLD function is active, you can, e.g. start a manual measurement with stability control.

2. Release the frozen measured value again with <AR>. The HOLD function is switched off. The [HOLD] status display disappears.

Stability control (AutoRead)

The stability control function (AutoRead) continually checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values. The display of the measured parameter flashes until a stable measured value is available.

You can start the Stability control function manually at any time, irrespective of the setting for automatic Stability control (see section 4.4.3) in the System menu.

1. Freeze the measured value with <AR>. The [HOLD] status indicator is displayed.
2 Using <MENU/ENTER>, activate the Stability control function manually. The [AR] status indicator appears while the measured value is assessed as not stable. A progress bar is displayed and the display of the measured parameter flashes. The [HOLD][AR] status indicator appears as soon as a stable measured value is recognized. The progress bar disappears and the display of the measured parameter stops flashing. The current measurement data is output to the interface. Measurement data meeting the stability control criterion is marked by AR.

**Note**
You can prematurely terminate the Stability control function manually with <MENU/ENTER> at any time. If the Stability control function is prematurely terminated, the current measurement data are output to the interface without the AutoRead info.

3 Using <MENU/ENTER>, start a further measurement with Stability control.

or

Release the frozen measured value again with <AR>. The display switches to the measured value display. The [AR][HOLD] status display disappears.

**Criteria for a stable measured value**
The Stability control function checks whether the measured values are stable within the monitored time interval.

<table>
<thead>
<tr>
<th>Measured parameter</th>
<th>Time interval</th>
<th>Stability in the time interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conductivity $\kappa$</td>
<td>10 seconds</td>
<td>$\Delta \kappa$: better than 0.5% of measured value</td>
</tr>
<tr>
<td>Temperature</td>
<td>10 seconds</td>
<td>$\Delta T (° C)$: Better than 0.02</td>
</tr>
</tbody>
</table>

The minimum duration until a measured value is assessed as stable is the monitored time interval. The actual duration is mostly longer.
4.9.3 Temperature compensation

The calculation of the temperature compensation is based on the preset reference temperature, 20 °C or 25 °C. It appears on the display as Tr20 or Tr25.

You can select one of the following temperature compensation methods:

- **Nonlinear temperature compensation (\textit{nLF})** according to EN 27 888
- **Linear temperature compensation (\textit{lin})** with adjustable coefficients of 0.000 ... 3.000 %/K
- **No temperature compensation (off)**

**Note**
The reference temperature and temperature compensation are set in the menu for the parameter, conductivity (see section 4.9.4).

**Application tips**
Select the following temperature compensations given in the table according to the respective test sample:

<table>
<thead>
<tr>
<th>Test sample</th>
<th>Temperature compensation</th>
<th>Display indicator</th>
</tr>
</thead>
<tbody>
<tr>

<td>Sal, \textit{nLF}</td>
</tr>
</tbody>
</table>
4.9.4 Settings for IDS conductivity sensors

Overview
The following settings are possible for IDS conductivity sensors:
- Calibration record (display)
- Calibration data storage (display)
- Calibration interval
- Reference temperature
- Temperature compensation
- TDS factor
- Unit of the temperature

Settings
The settings are made in the menu for the measured parameter, conductivity. To open the settings, display the required parameter in the measured value display and press the <MENU/ENTER> key. After completing the settings, switch to the measured value display with <M>.
The possible settings are individually displayed for each sensor. Below the setting menu is displayed for two IDS sensors (TetraCon 925, LR325/01).
Default settings are printed in **bold**.

<table>

</table>
4.9.5 Determining the cell constant  (calibration in control standard)

Why determine the cell constant?
Aging slightly changes the cell constant, e.g. due to coatings. As a result, an inexact measured value is displayed. The original characteristics of the cell can often be restored by cleaning the cell. Calibration determines the current value of the cell constant and stores this value in the meter. Thus, you should calibrate at regular intervals (we recommend: every 6 months).

Procedure
You can determine the actual cell constant of the IDS conductivity sensor cell by calibrating with the control standard in the following range:

- $0.450 \ldots 0.500 \text{ cm}^{-1}$
  (e.g. TetraCon 925, nominal cell constant 0.475)

The cell constant is determined in the control standard, 0.01 mol/l KCl.
In the delivery condition, the calibrated cell constant of the IDS sensor is set to 0.475 cm$^{-1}$ (conductivity measuring cell, TetraCon 925).

Stability control (AutoRead)
In calibration, the Stability control function (AutoRead) is automatically activated.

Display calibration data and output to interface
You can have the data of the last calibration displayed (see section 4.9.6). Subsequently, you can transmit the displayed calibration data to the interface, e.g. to a PC, with the <PRT> key.

Note
The calibration record is automatically transmitted to the interface after calibrating.

Sample record

<table>
<thead>
<tr>
<th>Multi 3410</th>

<td>Within the range $0.450 \ldots 0.500 \text{ cm}^{-1}$</td>
<td></td>
</tr>
</tbody>
</table>
Determining the cell constant

For this calibration procedure, the Type setting must be set to cal. Proceed as follows to determine the cell constant:

1. Connect an IDS conductivity sensor to the meter.

2. In the measured value display, select the conductivity parameter with <M>.

3. Start the calibration with <CAL>. The cell constant that was calibrated last is displayed.

4. Immerse the IDS conductivity sensor in the control standard solution, 0.01 mol/l KCl.

5. Start the measurement with <MENU/ENTER>. The measured value is checked for stability (stability control). The [AR] status indicator is displayed. The measured parameter flashes.

6. Wait for the measurement with stability control to be completed ([HOLD][AR]) display or accept the calibration value with <MENU/ENTER>. The calibration record is displayed and output to the interface.

7. Switch to the measured value display with <MENU/ENTER>.

<table>

</tbody>
</table>

Eliminate the error according to chapter 6 WHAT TO DO IF...
4.9.6 Displaying calibration records

The calibration data can be displayed and then output to the interface.

The calibration record of the last calibration is to be found under the menu item, Calibration / Calibration record. To open it in the measured value display, press the <CAL_> key.

The calibration records of the last 10 calibrations are to be found in the menu, Calibration / Calibration data storage / Display. To open the Calibration menu, press the <MENU/ENTER> key in the measured value display.

<table>
<thead>
<tr>
<th>Menu item</th>
<th>Setting/function</th>
<th>Description</th>
</tr>
</thead>
</table>
| Calibration / Calibration data storage / Display | - | Displays the calibration records. Further options:  
  - Scroll through the calibration records with <</>/>.  
  - Output the displayed calibration record to the interface with <PRT>.  
  - Output all calibration records to the interface with <PRT__>.  
  - Quit the display with <ESC> or <MENU/ENTER>.  
  - Switch directly to the measured value display with <M>. |
| Calibration / Calibration data storage / Copy to USB flash drive | - | Outputs the calibration data storage to a connected USB flash drive. |
| Calibration / Calibration data storage / Output to RS232/USB | - | Outputs the calibration data storage to the interface. |
4.10 Data storage

You can transmit measured values (datasets) to the data storage:

- Manual storage (see section 4.10.1)
- Automatic storage at intervals (see section 4.10.2)

Each storage process transmits the current dataset to the interface at the same time.

Measurement dataset

A complete dataset consists of:

- Date/time
- Meter name, series number
- Sensor name, series number
- ID number
- Measured value of the connected sensor
- Measured temperature value of the connected sensor
- AutoRead info: $AR$ appears with the measured value if the AutoRead criterion was met while storing (stable measured value). Otherwise, the $AR$ display is missing.
- Calibration evaluation:
  - 4 levels (+++, ++, +, -, or no evaluation) or
  - QSC (percentage)

Storage locations

The Multi 3410 meter has two measurement data memories. The measured values recorded either manually or automatic are stored separately in individual measurement data memories.

<table>
<thead>
<tr>
<th>Storage</th>
<th>Maximum number of datasets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual data storage</td>
<td>500</td>
</tr>
<tr>
<td>Automatic data storage</td>
<td>10000</td>
</tr>
</tbody>
</table>
4.10.1 Manual storage

You can transmit a measurement dataset to the data storage as follows. The dataset is at the same time output to the interface:

1. Press the <STO> key shortly. The menu for manual storage appears.

   ![Manual data storage menu]

If the storage is full

When all storage locations are occupied, it is not possible to continue storing. Then you can e.g. transmit the stored data to a PC or a USB flash drive (see section 4.10.3) and subsequently erase the storage (see section 4.10.4).

4.10.2 Automatic storage at intervals

The storage interval (Interval) determines the time interval between automatic storage processes. Each storage process transmits the current dataset to the interface at the same time.

Configuring the automatic storage function

1. Press the <STO> key. The menu for automatic storage appears.
Settings

You can configure the automatic storage function with the following settings:

<table>
<thead>
<tr>
<th>Menu item</th>
<th>Possible setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID number</td>
<td>1 ... 10000</td>
<td>ID number for the dataset series</td>
</tr>
<tr>
<td>Interval</td>
<td>1 s, 5 s, 10 s, 30 s, 1 min, 5 min, 10 min, 15 min, 30 min, 60 min</td>
<td>Storage interval. The lower limit of the storage interval can be restricted by the number of free storage locations. The upper limit is restricted by the storage duration.</td>
</tr>
<tr>
<td>Duration</td>
<td>1 min ... x min</td>
<td>Storage duration. Specifies after which time the automatic storage should be terminated. The lower limit of the storage duration is restricted by the storage interval. The upper limit is restricted by the number of free storage locations.</td>
</tr>
</tbody>
</table>

Starting the automatic storage function

To start the automatic storage function, select continue with <▲><▼> and confirm with <MENU/ENTER>. The meter switches to the measured value display.
The active automatic storage function can be recognized by the progress bar in the status line. The progress bar indicates the remaining storing duration.

**Note**
If the automatic storage function is activated, only the following keys are active: `<M>`, `<STO__>` and `<On/Off>`. The other keys and the automatic switch-off function are deactivated.

### Terminating the automatic storage function prematurely

Proceed as follows to switch off the automatic storage function before the adjusted storage duration has expired:

1. Press the `<STO__>` key.
   The following window appears.

   - **Warning**
     Stop automatic storage?

     - Yes
     - No

   22.09.2009 08:00

2. Using `<▲>` `<▼>`, select yes and confirm with `<MENU/ENTER>`.
   The meter switches to the measured value display.
   The automatic storage function is terminated.
4.10.3 Editing the measurement data storage

The contents of the manual or automatic measurement data storage can be shown on the display.

Each of the measurement data storages has a function to erase the entire contents.

**Editing the data storage**

The storage is edited in the menu, *Storage & config / Data storage*. To open the *Storage & config* menu, press the `<MENU/ENTER_>` key in the measured value display.

Open the manual or automatic storage directly with the `<RCL>` or `<RCL___>` key.

**Note**
The settings are explained here using the manual storage as an example. The same settings and functions are available for the automatic storage.

<table>
<thead>
<tr>

Quitting the display

To quit the display of stored measurement datasets, you have the following options:

- Switch directly to the measured value display with <M>.
- Quit the display and move to the next higher menu level with <ESC>.

4.10.4 Erasing the measurement data storage

How to erase the measurement data memory is described in section 4.10.3 EDITING THE MEASUREMENT DATA STORAGE.
4.11 Transmitting data (USB interfaces)

4.11.1 Outputting current measurement data

1. Output the current measurement data to the USB-B interface with <PRT>.

4.11.2 Transmitting data (to a PC)

The meter has the following interfaces:

- USB-B interface (*USB Device*), e.g. to connect a PC
- USB-A interface (*USB Host*), e.g. to connect a USB flash drive

Via the USB-B interface (*USB Device*) you can transmit data to a PC or printer and update the meter software.

Via the USB-A interface (*USB Host*) it is possible to transfer data to an external USB memory device.

4.11.3 Connecting the PC / USB-B interface (*USB Device*)

Connect the Multi 3410 to the PC via the USB-B interface.

System requirements of the PC for installation of the USB driver:

- PC with at least one free USB connection and CD-ROM drive

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Insert the supplied installation CD in the CD drive of your PC.</td>
</tr>
<tr>
<td>2</td>
<td>Install the driver from the CD. Follow the Windows installation instructions as necessary.</td>
</tr>
<tr>
<td>3</td>
<td>Connect the Multi 3410 to the PC via the USB-B interface. The meter is listed as a virtual COM interface among the connections in the Windows instrument manager.</td>
</tr>
</tbody>
</table>
4 Set the same transmission data at the connected instrument (PC):

- Baud rate: to be selected in the range 1200 ... 19200
- Handshake: RTS/CTS
- Set at the PC only:
  - Parity: none
  - Data bits: 8
  - Stop bits: 1

4.11.4 Options for data transmission to a PC (USB-B interface)

Via the USB-B interface you can transmit data to a PC. The following table shows which data are transmitted to the interface in which way:

<table>
<thead>
<tr>
<th>Data</th>
<th>Control</th>
<th>Operation / description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current measured</td>
<td>Manual</td>
<td>• With &lt;PRT&gt;</td>
</tr>
<tr>
<td>values of all</td>
<td></td>
<td>• Simultaneously with every manual storage process (see section 4.10.1)</td>
</tr>
<tr>
<td>connected sensors</td>
<td>Automatic, at intervals</td>
<td>• With &lt;PRT_&gt;. Then you can set the transmission interval</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Simultaneously with every automatic storage process (see section 4.10.2)</td>
</tr>
<tr>
<td>Stored measured</td>
<td>Manual</td>
<td>• Displayed dataset with &lt;PRT&gt; after calling up from the storage</td>
</tr>
<tr>
<td>values</td>
<td></td>
<td>• All datasets with the Output to RS232/USB function</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For details, see section 4.10.3.</td>
</tr>
<tr>
<td>calibration records</td>
<td>Manual</td>
<td>• Displayed calibration record with &lt;PRT&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• All calibration records with &lt;PRT_&gt;.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For details, see section 4.11.</td>
</tr>
<tr>
<td></td>
<td>Automatic</td>
<td>• At the end of a calibration procedure</td>
</tr>
</tbody>
</table>

Note

The following rule applies: With the exception of the menus, shortly pressing the <PRT> key generally outputs the display contents to the interface (displayed measured values, measuring datasets, calibration records).
4.11.5 Connecting the USB memory device / USB-A interface (*USB Host*)

Connect the USB-A interface (*USB Host*) of the Multi 3410 to a USB flash drive.

1. Connect a USB flash drive to the *USB Host* interface.

4.11.6 Data transmission to a USB memory device (USB-A interface)

Via the USB-A interface you can transmit data to a USB memory device. The following table shows which data are transmitted to the interface in which way:

<table>
<thead>
<tr>
<th>Data</th>
<th>Control</th>
<th>Operation / description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stored measured values</td>
<td>Manual</td>
<td>All datasets with the <em>Output to RS232/USB</em> function. For details, see section 4.10.3.</td>
</tr>
<tr>
<td>Calibration data storage</td>
<td>Manual</td>
<td>All stored calibration records of a sensor with the <em>Copy to USB flash drive</em> function. For details, see the menu for calibration and measurement settings of the sensor.</td>
</tr>
</tbody>
</table>
4.12 Reset

You can reset (initialize) all sensor settings and sensor-independent settings separately from each other.

4.12.1 Resetting the measurement settings

**Note**
The calibration data are reset to the default settings together with the measuring parameters. Recalibrate after performing a reset.

**pH**
The following settings for pH measurements are reset to the default settings with the *Reset* function:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffer</td>
<td>AutoCalTEC</td>
</tr>
<tr>
<td>Cal. interval</td>
<td>7 d</td>
</tr>
<tr>
<td>Unit for slope</td>
<td>mV/pH</td>
</tr>
<tr>

<tr>
<td>Slope</td>
<td>-59.2 mV</td>
</tr>
<tr>
<td>Man. temperature</td>
<td>25 °C</td>
</tr>
<tr>
<td>Single-point calibration</td>
<td>Off</td>
</tr>
</tbody>
</table>

The sensor settings are reset under the *Reset* menu item in the menu for calibration and measurement settings. To open the settings, display the required parameter in the measured value display and press the `<MENU/ENTER>` key.

**ORP**
The following settings for ORP measurements are reset to the default settings with the *Reset* function:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>mV resolution</td>
<td>0.1</td>
</tr>
<tr>
<td>Man. temperature</td>
<td>25 °C</td>
</tr>
</tbody>
</table>

The sensor settings are reset under the *Reset* menu item in the menu for calibration and measurement settings. To open the settings, display
the required parameter in the measured value display and press the <MENU/ENTER> key.

**Dissolved oxygen**

The following settings for D.O. measurements are reset to the default settings with the *Reset* function:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cal. interval</td>
<td>180d</td>

5 Maintenance, cleaning, disposal

5.1 Maintenance

The only maintenance activity required is replacing the batteries.

Note
See the relevant operating manuals of the IDS sensors for instructions on maintenance.

5.1.1 Replacing the rechargeable batteries

1 Unscrew the two screws (1) on the underside of the meter.

2 Open the battery compartment (2) on the underside of the meter.

3 Remove the four rechargeable batteries from the battery compartment.

4 Place four new rechargeable batteries (type Mignon AA) in the battery compartment.

CAUTION
Make sure that the poles of the rechargeable batteries are positioned correctly.
The ± signs on the batteries must correspond to the ± signs in the battery compartment.
5.2 Cleaning

Occasionally wipe the outside of the measuring instrument with a damp, lint-free cloth. Disinfect the housing with isopropanol as required.

**CAUTION**
The housing is made of synthetic material (ABS). Thus, avoid contact with acetone or similar detergents that contain solvents. Remove any splashes immediately.

5.3 Packing

This meter is sent out in a protective transport packing. We recommend: Keep the packing material. The original packing protects the meter against damage during transport.

5.4 Disposal

**Note**
This meter contains rechargeable batteries. Batteries that have been removed must only be disposed of at a recycling facility set up for this purpose or via the retail outlet. It is illegal to dispose of the batteries in household refuse.

Within the European Union, the batteries are removed at a specialized treatment center at the instrument's end of life. The instruments are taken to one of those specialized treatment centers via the recycling system set up for this purpose.

5  Close the battery compartment (2) and tighten the screws (1).

### 7.2 Measuring ranges, resolution, accuracy

**Note**

These data are given in the documentation of your sensor.

---

**FCC Class A Equipment Statement**

*Note:* This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense. Changes or modifications not expressly approved by the manufacturer could void the user's authority to operate the equipment.
8  Lists

This chapter provides additional information and orientation aids.

Specialist terms  The glossary briefly explains the meaning of the specialist terms. However, terms that should already be familiar to the target group are not described here.

Index  The index will help you to find the topics that you are looking for.

Glossary

Adjusting  To manipulate a measuring system so that the relevant value (e. g. the displayed value) differs as little as possible from the correct value or a value that is regarded as correct, or that the difference remains within the tolerance.

Asymmetry  see zero point

AutoRange  Name of the automatic selection of the measuring range.

Calibration  Comparing the value from a measuring system (e. g. the displayed value) to the correct value or a value that is regarded as correct. Often, this expression is also used when the measuring system is adjusted at the same time (see adjusting).

D.O. partial pressure  Pressure caused by the oxygen in a gas mixture or liquid.

Electromotive force of an electrode  The electromotive force \(U\) of the combination electrode is the measurable electromotive force of an electrode in a solution. It equals the sum of all the galvanic voltages of the combination electrode. Its dependency on the pH results in the electrode function, which is characterized by the parameters, slope and zero point.

Junction  The junction is a porous body in the housing wall of reference electrodes or electrolyte bridges. It arranges the electrical contact between two solutions and makes the electrolyte exchange more difficult. The expression, junction, is also used for ground or junctionless transitions.

Measured parameter  The measured parameter is the physical dimension determined by measuring, e. g. pH, conductivity or D.O. concentration.

Measured value  The measured value is the special value of a measured parameter to be determined. It is given as a combination of the numerical value and unit (e. g. \(3\) m; \(0.5\) s; \(5.2\) A; \(373.15\) K).
<table>
<thead>
<tr>
<th><strong>Term</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>ORP voltage</td>
<td>The ORP is caused by oxidizing or reducing substances dissolved in water if these substances become effective on an electrode surface (e.g. a gold or platinum surface).</td>
</tr>
<tr>
<td>Oxygen saturation</td>
<td>Short name for &quot;Relative D.O. saturation&quot;.</td>
</tr>
<tr>
<td>pH value</td>
<td>The pH value is a measure of the acidic or basic effect of an aqueous solution. It corresponds to the negative decadic logarithm of the molal hydrogen ions activity divided by the unit of the molality. The practical pH value is the value of a pH measurement.</td>
</tr>
<tr>
<td>Potentiometry</td>
<td>Name of a measuring technique. The signal (depending on the measured parameter) of the electrode is the electrical potential. The electrical current remains constant.</td>
</tr>
<tr>
<td>Reset</td>
<td>Restoring the original condition of all settings of a measuring system.</td>
</tr>
<tr>
<td>Resolution</td>
<td>Smallest difference between two measured values that can be displayed by a meter.</td>
</tr>
<tr>
<td>Salinity</td>
<td>The absolute salinity $S_A$ of seawater corresponds to the relationship of the mass of dissolved salts to the mass of the solution (in g/Kg). In practice, this dimension cannot be measured directly. Therefore, the practical salinity according to IOT is used for oceanographic monitoring. It is determined by measuring the electrical conductivity.</td>
</tr>
<tr>
<td>Salt content</td>
<td>General designation for the quantity of salt dissolved in water.</td>
</tr>
<tr>
<td>Slope</td>
<td>The slope of a linear calibration function.</td>
</tr>
<tr>
<td>Stability control</td>
<td>Function to control the measured value stability.</td>
</tr>
<tr>
<td>(AutoRead)</td>
<td></td>
</tr>
<tr>
<td>Standard solution</td>
<td>The standard solution is a solution where the measured value is known. It is used to calibrate a measuring system.</td>
</tr>
<tr>
<td>Test sample</td>
<td>Designation of the test sample ready to be measured. Normally, a test sample is made by processing the original sample. The test sample and original sample are identical if the test sample was not processed.</td>
</tr>
<tr>
<td>Zero point</td>
<td>The zero point of a pH combination electrode is the pH value at which the electromotive force of the pH combination electrode at a specified temperature is zero. Normally, this is at 25 °C.</td>
</tr>

Appendix: Firmware update

With the Multi 3410 you can update the firmware of your meter and IDS sensors.

9.1 Firmware update for the meter Multi 3410

General information
Available firmware updates for the meter are provided on the Internet. With the "Firmware Update " program and a PC you can update the firmware of the Multi 3410 to the newest version.

For the update you have to connect the meter to a PC.

For the update via the USB-B interface, the following is required:
- a free USB interface (virtual COM port) on the PC
- the driver for the USB interface (on the enclosed CD-ROM)
- the USB cable (included in the scope of delivery of the Multi 3410).

Program installation

1. Install the downloaded firmware update on a PC.
   An update folder is created in the Windows start menu. If an update folder already exists for the meter (or meter type), the new data are displayed there.

Program start

2. In the windows start menu, open the update folder and start the firmware update program for the meter

Firmware update

3. Using the USB interface cable, connect the Multi 3410 to a USB interface (virtual COM port) of the PC.

4. Switch on the Multi 3410.

5. In the firmware update program, start the update process with OK.

6. Follow the instructions of the firmware update program. During the programming process, a corresponding message and a progress bar (in %) are displayed. The programming process takes up to 15 minutes. A termination message is displayed after a successful programming process. The firmware update is completed.

7. Disconnect the Multi 3410 from the PC. The Multi 3410 is ready for operation again.

After switching the meter off and on you can check whether the meter has taken over the new software version (see page 103).
9.2 Firmware-Update for IDS Sensors

**General information**
Available firmware updates for IDS sensors are provided on the Internet. With the "Firmware Update" program and a PC you can update the firmware of an IDS sensor to the newest version.

For updating, connect the IDS sensor to the Multi 3410, and the Multi 3410 to a PC.

For the update via the USB-B interface, the following is required:
- a free USB interface (virtual COM port) on the PC
- the driver for the USB interface (on the enclosed CD-ROM)
- the USB cable (included in the scope of delivery of the Multi 3410).

**Program installation**
1. Install the downloaded firmware update on a PC.
   An update folder is created in the Windows start menu. If an update folder already exists for the sensor (or sensor type), the new data are displayed there.

**Program start**
2. In the Windows start menu, open the update folder and start the firmware update program for the IDS sensor.

**Firmware update**
3. Connect the IDS sensor to the Multi 3410 meter.
4. Using the USB interface cable, connect the Multi 3410 to a USB interface (virtual COM port) of the PC.
5. Switch on the Multi 3410.
6. In the firmware update program, start the update process with OK.
7. Follow the instructions of the firmware update program. During the programming process, a corresponding message and a progress bar (in %) are displayed. The programming process takes up to 5 minutes. A terminatory message is displayed after a successful programming process. The firmware update is completed.
8. Disconnect the Multi 3410 from the PC. Meter and sensor are ready for operation again.

After switching the meter off and on you can check whether the sensor has taken over the new software version (see page 103).
